

Haritha Hospitals ERPNext — Client Overview

For: Prospective hospital clients evaluating Haritha Hospitals ERPNext. **Reading time:** 5 minutes. **Last updated:** 2026-08-29

What is Haritha Hospitals ERPNext?

Haritha Hospitals ERPNext is a **complete hospital staff-management and payroll system** built on top of Frappe ERPNext + HRMS — running in production at a real 200+-employee hospital since 2026, with **every customization version-controlled in git** so your deployment is reproducible, auditable, and yours to own.

It is not a generic SaaS you rent. It is a **self-hosted, hospital-tuned, open-source core** with our 274 battle-tested customizations — covering shift scheduling, attendance, leave, payroll, and the Indian statutory stack (PF, ESI, TDS) — packaged into a custom app that can be installed on any Frappe environment with a single command.

Key features

HRMS — staff management

Feature	What it does
Shift Management	25 predefined shift types (Morning, Afternoon, Night, General) with monthly Roster grid, color-coded per shift, swap requests, automatic schedule templates
Attendance	Auto-marked from biometric check-ins every minute; manual override for missed punches; half-day / absent / leave / holiday detection
Leave	7 leave types (Casual, Sick, Earned, etc.), per-employee annual allocation, approval workflow, leave balance carry-over, block lists for peak season
Holidays	Per-company holiday calendar linked to shifts + employees, automatic Holiday status on those dates
Payroll	Monthly Payroll Entry → Salary Slips → Journal Entry to GL → bank file; PF / ESI / TDS / professional tax out of the box
Employee Checkins	Raw biometric log; bi-directional sync with HRMS Roster
Shift Request	Employee-initiated shift swap requests, approver-driven, audit trail
Recruitment (future)	Job Opening → Applicant → Interview → Offer → Onboarding workflow
Training (future)	Training Program + Event + Result + Feedback
Appraisal (future)	Goal setting, KRAs, review cycles

Hospital-specific customizations

Built into our custom app (haritha_hospital), 78 Custom Fields and 189 Property Setters tuned for hospital workflows:

- **Employee** — Default Shift, Approvers (Leave / Expense / Shift), PAN, IFSC, MICR, Health Insurance, Payroll Cost Center, Provident Fund Account
- **Department** — Payroll Cost Center linkage for cost allocation
- **Company** — Default accounts for Payroll Payable, Employee Advance, Expense Claims, plus HRA / Basic / Arrear salary component references
- **Holiday handling** — Per-employee Holiday List, weekend rules, region-specific calendars
- **Shift Type** — Color coding aligned with the HRMS Roster SPA, on-call / emergency shift tags

Custom App — portability

All 274 customizations ship as **JSON fixtures** inside the haritha_hospital Frappe app. Reproduce any environment from scratch with three commands:

```
bench get-app haritha_hospital git@github.com:venkat-narasimha/haritha_hospital.git
bench --site <yoursite> install-app haritha_hospital
bench --site <yoursite> migrate
```

Result: same customizations on dev, staging, prod, future replicas. No manual re-clicking through the UI.

Why choose us

1. **Built specifically for hospital operations.** Not a generic HR system with hospital as an afterthought — every Custom Field, every Property Setter, every workflow reflects how a real 200+-employee hospital runs shifts, attendance, and payroll. We've been running this in production since 2026 with 8,000+ shift assignments and 6,300 attendance records.
2. **HRMS-first design (not bolted on).** Most ERPs treat HR as one module among many. Haritha puts HRMS at the center — Shift Management is the first screen your HR manager opens every morning, not a side menu. This is the system our users actually use, every day, all day.
3. **274 production-validated customizations.** Every Custom Field, Property Setter, Print Format, Notification, and Letter Head has been live in production, exercised by real users, and proven against the edge cases that break naive deployments (e.g., Tailwind color case-sensitivity in the Roster SPA, HRMS last_sync_of_checkin defaults, employee ID remapping across environments).
4. **Disaster-recovery tested.** We don't just claim backups — we've executed the recovery. Automated daily backups (3-2-1 rule: 3 copies, 2 media, 1 offsite), offsite push to a separate VPS, SHA256 verification, monthly heartbeat checks. RTO (recovery time objective) and RPO (recovery point objective) targets documented and tested.
5. **Full ownership of customization code.** Our 274 customizations live in a public GitHub repo under our organization's control. No vendor lock-in. No "we'll email you the patches". You can fork it, audit it, modify it, or hire any Frappe developer in the world to maintain it.

Quick facts

Item	Value
Production deployment	pberpprod.duckdns.org (since 2026)
Employees managed	210+ active employees
Shift Assignments managed	8,000+ across 25 shift types
Attendance records processed	6,300+ monthly
Departments	36 (Nursing, Pharmacy, Lab, Housekeeping, Security, Admin, ...)
Designations	51 (Staff Nurse, Consultant, Pharmacist, ...)
Customizations	274 (78 Custom Field + 189 Property Setter + 3 Print Format + 2 Notification + 2 Letter Head)
Environments	3 — dev (pberpdev), staging (pberpqa), production (pberpprod)
Frappe version	v16.30.0
ERPNext version	v16.30.0
HRMS version	v16.5.0 (pinned per upstream bug)
Database	MariaDB 10.x
Cache / queue	Redis (cache db 1, queue db 0)
Backup cadence	Daily, automated, 3-2-1 rule
Uptime SLA	Best-effort, no current SLA (documented runbook for incident response)

Tech stack summary

Layer	Technology
Backend	Python 3.11 + Frappe framework
Frontend	Vue 3 (HRMS Roster SPA) + vanilla JS (forms)
Database	MariaDB 10.x
Cache / queue	Redis
Realtime	Socket.IO (Node.js) for desk notifications
Web server	gunicorn (app) + nginx (TLS termination + reverse proxy)
Background workers	bench worker (short + long queues) + bench schedule (cron)
Containerization	Docker Compose (9 containers per environment)
TLS	Let's Encrypt via Certbot
DNS	DuckDNS (free dynamic DNS for VPS hosting)
Source control	GitHub (private or public repo, your choice)
Backup	cron + rsync + SHA256 verification + offsite VPS copy

What this means for your hospital

If you're evaluating this for your own hospital:

- **Time to value:** ~1 week to deploy + populate 200 employees + 25 shifts + holiday list. The migration script (`migrate_master_data.py`) replays our prod data into your env in minutes.
- **Customizations are not magic.** Every Custom Field and Property Setter is in the repo, named clearly, with a fixture export. Your team (or any Frappe developer) can read the code and understand what each one does.
- **No surprises.** If we vanish tomorrow, your hospital keeps running. The customizations are yours, the code is in your GitHub, the data is in your MariaDB.
- **Path forward.** Once you're live on shift + attendance + leave + payroll, additional modules (full accounting, inventory, pharmacy, lab, billing, patient management) can be added incrementally without disrupting what works.

Get started

To request a demo, deployment quote, or reference call with our existing customer:

Contact	Detail
Email	<code>sales@example.com</code> (<i>placeholder</i>)
Phone	<code>+91-XXXX-XXXXXX</code> (<i>placeholder</i>)
Demo site	<code>https://pberpprod.duckdns.org/</code> (<i>read-only demo creds on request</i>)
Documentation	This <code>/docs/phase6/</code> directory
Source repo	<code>https://github.com/venkat-narasimha/haritha_hospital</code>

Pricing: TBD. Contact us for a tailored quote based on employee count, modules, and hosting preference (self-hosted VPS vs. managed).
